

## Nitrogen Cooling Manifold (Model RPR-NMS)

**Used for Rayonet Model RPR-100 and RPR-200.**

This light-weight compact design is capable of lowering the reaction chamber temperature to 0°C. When sensitive reactions cannot be achieved due to high temperature interference, this newly developed manifold will deliver the added cooling you need.

Attaches to your dewar and operates off the vent line. The cold gas flow is controlled by the metered flow valve on the control panel, delivering a steady flow of cold nitrogen gas to the chamber.
